

## CLAIMS

I claim:

1. A dispenser for dispensing personal healthcare products comprising:  
a) at least one dispenser section and one disposal section attached to said dispenser section, wherein each of said dispenser sections has at least one dispensing orifice for dispensing healthcare products and said disposal section has at least one disposal opening for disposing of said healthcare products;  
b) said disposal section having, relative to said dispenser section, a fully compressed position for transport and storage and a fully uncompressed position for use, said disposal section being capable of remaining positioned in any position between said compressed position and said uncompressed position.

2. The dispenser described in claim 1 wherein said disposal section has top, bottom and side walls and said side walls are formed such that discrete sections of said side walls meet at angles in an accordion-like fashion to permit full, partial or no compression of the disposal section wherein said angles between said discrete sections in said fully compressed position approximate zero degrees and said angles between said discrete sections in said fully uncompressed position approximate ninety degrees.

3. The dispenser described in claim 1 wherein said dispenser has one dispenser section with one dispensing orifice and one disposal section with one disposal opening.

4. The dispenser described in claim 3 wherein said dispenser section is integrally attached to said disposal section.

5. The dispenser described in claim 4 wherein said dispenser section has top, bottom and side walls and a pivotable door located in said bottom wall of said dispenser section and said healthcare products are dispensed from a cartridge within said dispenser section.

6. The dispenser described in claim 3 wherein said dispenser section is removably attached to said disposal section.

7. The dispenser described in claim 6 wherein said dispenser section is removably attached to said disposal section enabling replacement of said dispenser section with a new disposal section upon use of all of said healthcare products.

8. The dispenser described in claim 7 wherein said dispenser section is removably attached to said disposal section with mating male and female threaded screw mechanisms.

9. The dispensers described in claim 5 or 7 wherein said healthcare products are tissues.

10. The dispenser described in claim 3 wherein said disposal section has a top lid.

11. The dispenser described in claim 10 wherein said disposal section has bottom and side walls and said top lid is integrally attached to said side walls and forms a top wall, said top lid having a pivotable door located in said top lid permitting emptying of used healthcare products from said disposal section.

12. The dispenser described in claim 10 wherein said disposal section has top, bottom and side walls and said top lid is removably attached to said side walls and forms a top wall, wherein removal of said top lid permits emptying of used healthcare products from said disposal section.

13. The dispenser described in claim 12 wherein said top lid is removably attached to said side walls with mating male and female threaded screw mechanisms.

14. The dispenser described in claim 3 wherein said dispenser section has top, bottom and side walls and said dispensing orifice is located in said bottom wall of said dispenser section and said dispenser section is removably attached to said disposal section and said disposal section has top and side walls and said disposal opening is located in said top wall of said disposal section.

15. The dispenser described in claim 3 wherein said dispenser section has bottom and side walls and said dispensing orifice is located in said bottom wall of said dispenser section and said dispenser section is removably attached to said disposal section and said disposal section has top, bottom and side walls and said disposal opening is located in said top wall of said disposal section.

16. The dispenser described in claim 4 wherein said dispenser section is formed with side and bottom walls and said disposal section is formed with top and side walls, and either the dispenser section has a top wall or the disposal section has a bottom wall which forms a separating wall between the dispenser and disposal sections, and access to the interior of said dispenser section is exclusively by said dispensing orifice and access to the interior of said disposal section is exclusively by said disposal opening and said dispenser is discarded upon use of all of said healthcare products.
